CHORD FLOW

Make your *static* chords come alive

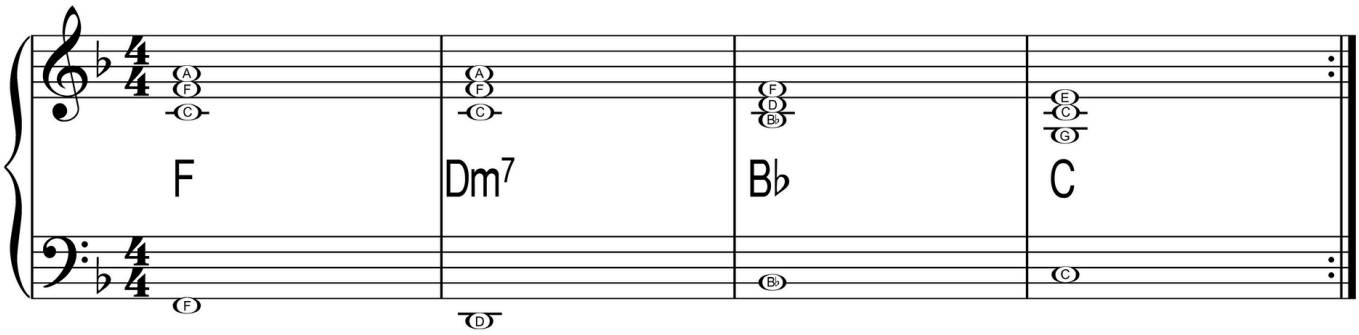

Introduction *from Adam*

When chords feel static, this simple trick changes everything. By shifting a few shapes in your right hand, you can make progressions sound smooth, flowing, and expressive — fun to play and effective in many styles.

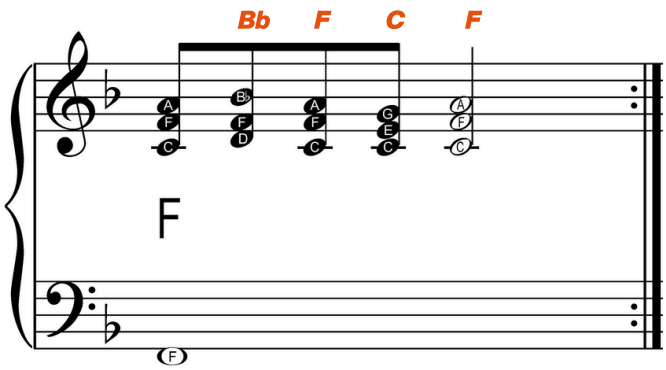

The Starting Progression

If we take a regular chord progression in F major (I–vi–IV–V), here's how those chords might sound in their basic form.

Adding Flow

To make the progression feel more flowing, we can change the shape in our right hand by using the primary triads of the key (I, IV & V).

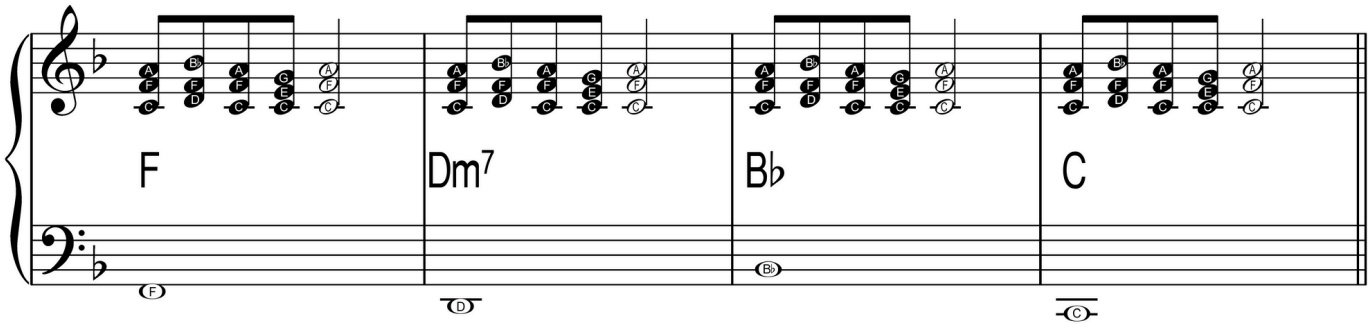

In F major, these are F, Bb, and C.

The crucial point is that the left hand stays on F — only the right-hand shape changes.

Apply to All Chords

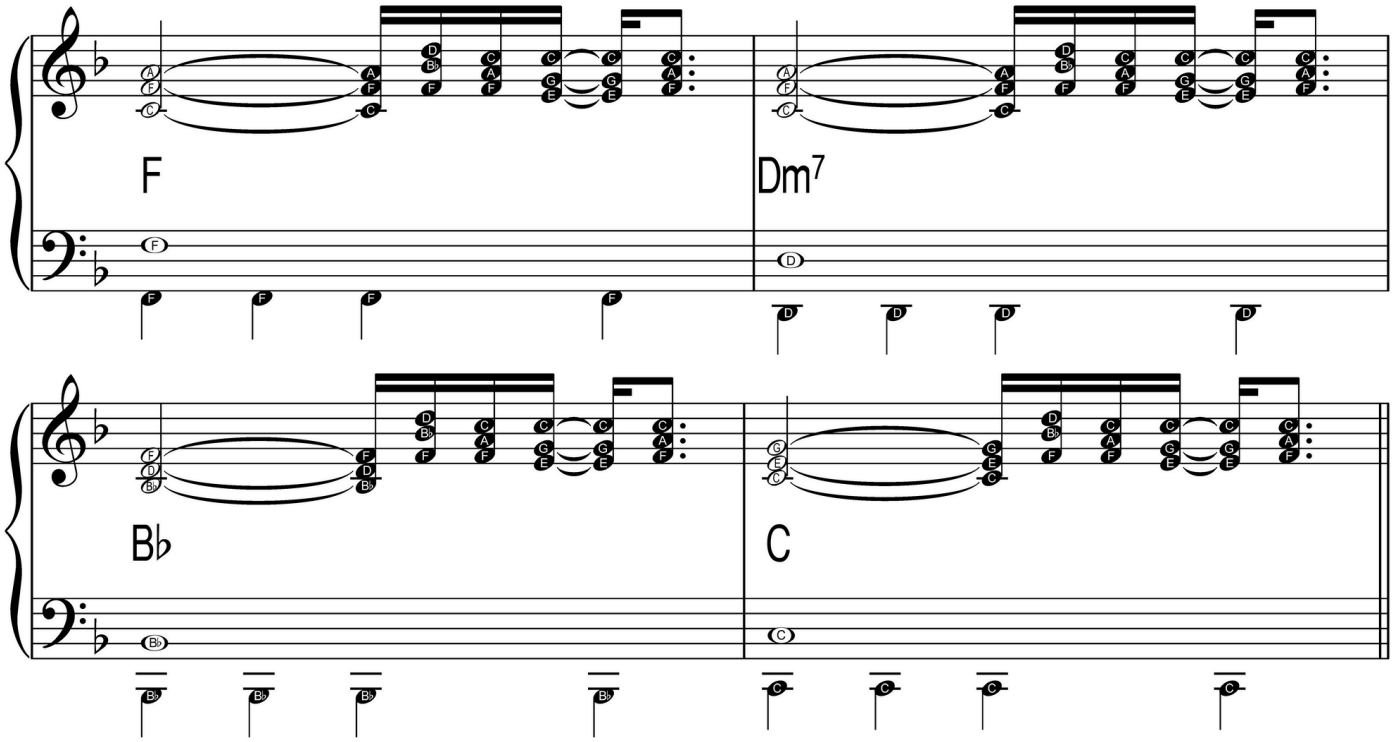

You can now use this right-hand movement on every chord in the sequence.

Note: This approach works especially well with the progression we're using, but it's not a one-size-fits-all. As progressions get more complex, you may need to adapt the shapes.

One Melody, Every Chord

Now let's take one melody and apply it to every chord. This is what creates that sense of continuity and flow in a progression.

The next step is to improvise with rhythm while moving between these shapes. Once the chord flow feels natural, rhythm is what really brings your playing to life.
